

REMOTE, AUTOMATIC REPORTING SYSTEM AND METHOD

ABSTRACT OF THE DISCLOSURE

One or more parameters such as time is reported to a center using a form. The center then automatically extracts data from the form and converts it for storage and subsequent processing or review. The form is preferably a physical form, which the sender fills in and then faxes to the center. Image capture, registration, and feature recognition routines are included to enable the center to extract the reported data with no need for data reentry or human intervention. The invention is particularly suitable for employees who need to submit time sheets, expense reports, and the like to an employer, or for automatic analysis of submitted inventory reports, product orders, etc.
